MODULE NAME:MOBILE APP SCRIPTING

MODULE CODE: MAST5112

MAST5112 ASSIGNMENT PART 1

PLANNING THE MOBILE APPLICATION

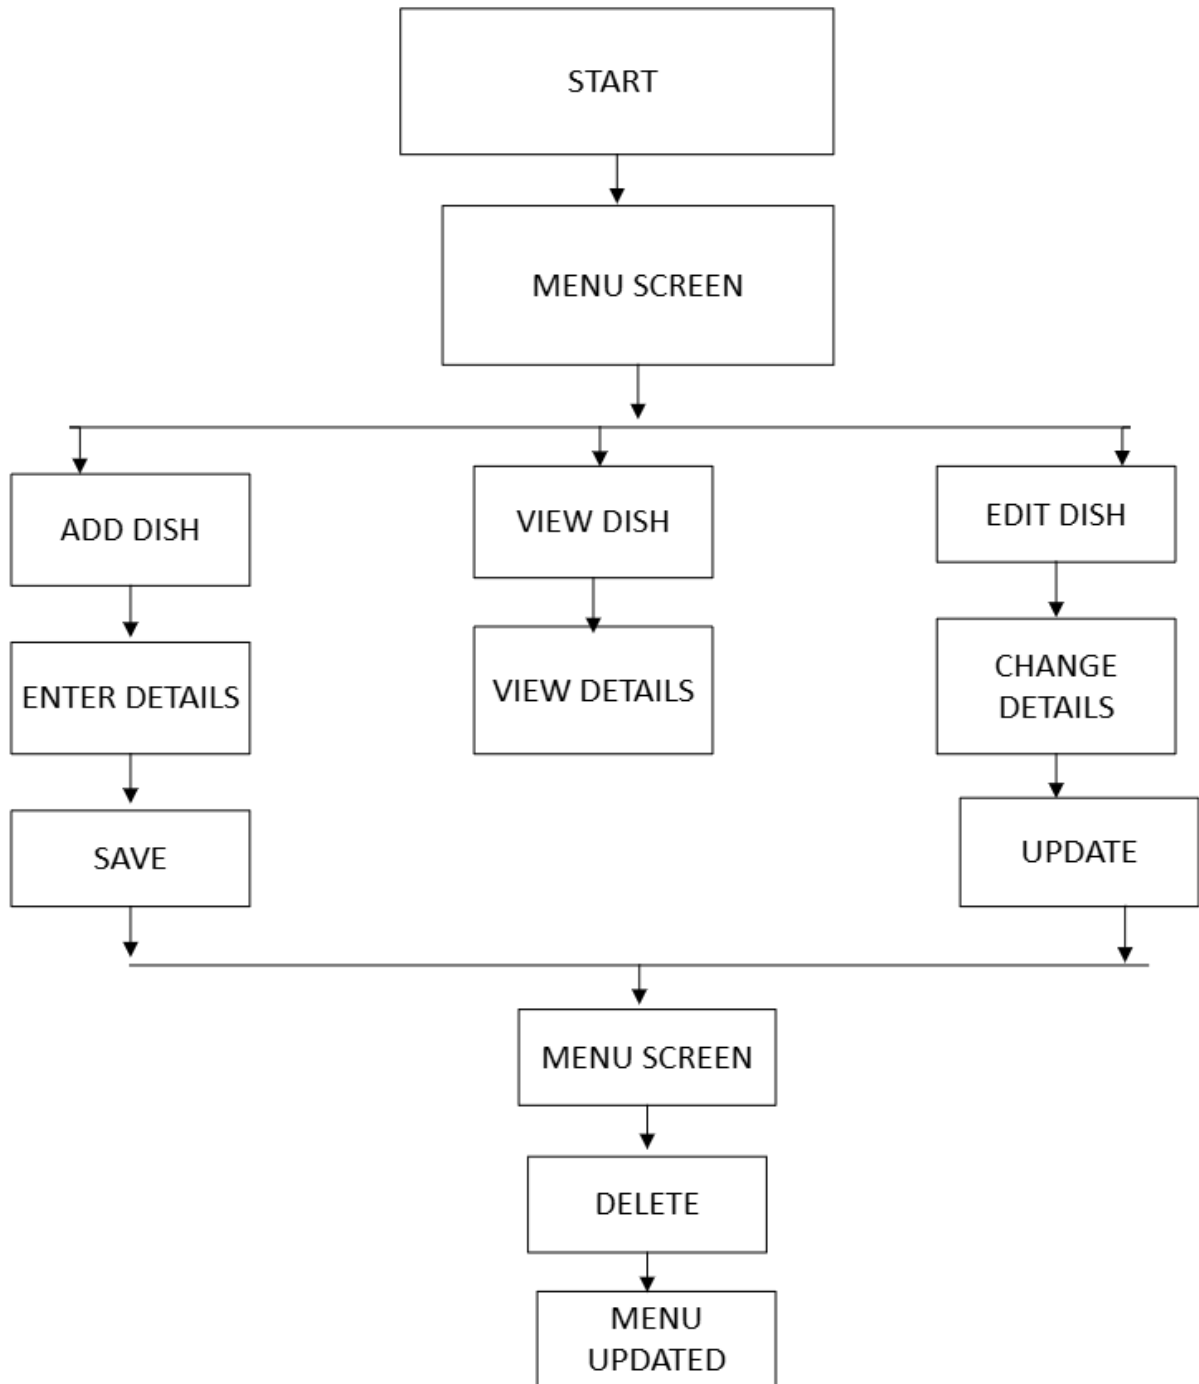

1. Scenario Analysis

REQUIREMENTS	YOUR RESPONSE
Who will use the application?	The main person who will use the application is the chef at Christoffel's restaurant. The chef will use it on an Android phone to manage the restaurant's menu.
What is the purpose of the application?	The application is meant to make managing the restaurant menu easier. Instead of writing menu information on paper, the chef will be able to add, view, change and remove dishes using the mobile application.
What information must the application store?	It must store the dish name, description, course and price. The course can be a Starter, Main Course or Dessert.
List four functions the application should perform	1. Add a new dish. 2. View existing dishes. 3. Update information about a dish. 4. Delete a dish that is no longer on the menu.
List two usability requirements.	1. The application should be simple and easy to understand. 2. The menu should be organised so that the chef can find information quickly.

2. User Interface Design

3.Application Flow

3. React Native Component Planning

Application Requirement	React Native Component	Purpose
Display a heading	Text	Used to display headings, labels and other text.
Enter the dish name	Text Input	Allows the chef to type the name of the dish.
Enter the description	Text Input	Allows the chef to type information about the dish.
Select a course	Picker	Allows the chef to choose Starter, Main Course or Dessert.
Enter the price	Text Input	Allows the chef to enter the price of the dish.
Save a menu item	Button	Allows the chef to save a new menu item.
Display menu items	Flat List	Displays the saved dishes in a scrolling list.

4. Design Reflection

My idea for this application is to make managing the restaurant menu easier for the chef. Now, the menu information is kept on paper, which can become difficult when dishes need to be changed or new dishes are added. With the application, the chef will be able to keep all the menu information in one place and access it is using a mobile phone.

I decided to keep the design simple because the application is mainly going to be used by the chef. The main screen will show the different menu items, and the chef will be able to add a new dish or select an existing dish to view, edit or delete it. I also included separate fields for the dish name, description, course and price because these are the important details that the application needs to keep.

For the React Native components, I chose components according to what they are needed for. For example, I would use Text for headings and labels and Text Input where the chef needs to type information. A picker can be used when selecting the course of the dish, while Flat List can display several dishes without making the screen too crowded. Buttons will be used for actions such as saving, updating and deleting menu items.

Overall, I think this design would make the chef's work easier because the information would be organised and easier to update than using paper. The application is also designed to have

clear screens and simple navigation so that the chef can use it without struggling to understand it.
